## Unit 5: Percent

## Dear Parents/Guardians,

In Unit 5, students explore percent. In Lesson 1, students use visuals and procedures to change a fraction to a decimal and a percent. In Lesson 2 , students find the percent of a number using sense-making and procedural methods. In Lesson 3, they revisit double number lines to solve more complex percent problems.

## Percent

Since percent means parts per hundred, a $10 \times 10$ grid is a helpful picture for converting between a fraction, a decimal and a percent.
Example: What percent is represented by $\frac{8}{25}$ ?

Students might determine the percent by shading 8 of every 25 squares four times to see:

$$
\frac{8}{25}=\frac{32}{100} \text { or } 32 \%
$$

Or they may use the "big one" computation:

$$
\frac{8}{25} \times \frac{4}{4}=\frac{32}{100} \text { or } 32 \%
$$

## Chunking to Find Percent of a Number

Students use a predominantly mental "chunking" procedure to find the percent of a number when the values are "friendly."
Example: Find $15 \%$ of $\$ 80$.

| Amount of \$ | Find $\mathbf{1 0 0 \%}$ | Find $10 \%$ | Find $5 \%$ |
| :---: | :---: | :---: | :---: |
| $\$ 80$ | $\$ 80$ | $\$ 8$ | $\$ 4$ |
|  | $100 \%$ is <br> always the <br> whole <br> amount | Find $\frac{1}{10}$ of $\$ 80$ to get | Find $\frac{1}{2}$ of $\$ 8$ to get $5 \%$. |
|  | $\frac{10 \%}{10}$ of $100 \%$ | $\frac{1}{10}=\$ 8$ | $\frac{\$ 8}{2}=\$ 4$ |

One way to use chunking to find $15 \%$ of $\$ 80$ :

| $15 \%$ of $\$ 80=10 \%$ of $\$ 80+5 \%$ of $\$ 80$. |
| :---: |
| $15 \%$ of $\$ 80=\$ 8+\$ 4=\$ 12$. |

## Using Double Number Lines in Percent Problems

Students revisit double number lines to find the missing values in percent problems.
Example: 24 is $10 \%$ of what number?

One of the lines represents percent, and is numbered from $0 \%$ to $100 \%$ in increments of $10 \%$. If the other line is also split into 10 equal parts, we know that 24 lines up with $10 \%$. We can count up by 24 's to find the total amount, which is 240.
Another method is to recognize that $10(10 \%)=100 \%$, so $10(24)=240$.

Center For Mathematics And Teaching

## Math <br> GRADE 6 <br> inks

By the end of the packet, your student should know...

- Percent means parts per hundred [Lesson 5.1]
- How to convert between fractions, decimals, and percent representations [Lessons 5.1, 5.2]
- How to find a percent of a number using a variety of methods [Lessons 5.2, 5.3]

## Additional Resources

- For definitions and additional notes please refer to Student Resources at the end of the packet.
- To convert between fractions, decimals and percent: https://youtu.be/wwg052FC _ Zw
- To convert from a percent to a fraction or decimal: https://bit.ly/2Y5Nicc
- To find the percent of a number using double number lines:
https://youtu.be/2NYSa ili3Q and https:///youtu.be/lrhiXeCekyk
- Finding percent of a number using symbolic notation: https://bit.ly/2zHhygm
