## Packet 9: Area and Volume

## Dear Parents/Guardians,

## Packet 9 explores area and volume. In Lesson 1 students derive the

 formulas for finding the areas of polygons using visual models and use these formulas to solve various problems. In Lesson 2 students explore 3-D figures, draw nets of the figures, and calculate the surface area of each by finding the area of its related net. In Lesson 3 students explore volumes of rectangular prisms, focusing on prisms with fractional edge lengths.
## Areas of Polygons

Students make copies of polygons and use a "cut-up" strategy to manipulate figures and derive area formulas for parallelograms, triangles, and trapezoids. They use the formula or the area of a rectangle to derive the area formulas for the other figures. (Please see tutorial link for deriving the area of parallelograms.) (Area $=$ base $\times$ height or $A=b \times h$ )

The area of the parallelogram (or the two triangles) is $A=b \times h$.

The area of one triangle is half of the area of the parallelogram.

$$
A=\frac{1}{2}(b \times h)
$$

The area of the parallelogram (or the two trapezoids) is $A=b \times h$.
The area of one trapezoid is
half of the area of the parallelogram.
$A=\frac{1}{2}\left(\right.$ base $_{1}+$ base $\left._{2}\right) \times h$

## Surface Area of Prisms

Students create net drawings of prisms. They find the area of each polygon within the net, and find the total surface area of the prism.

## Surface Area of Prism

Method 1: Add all of the net areas.

$$
\begin{aligned}
& S A=42+42+21+21+18+18 \\
& S A=162 \mathrm{~cm}^{2}
\end{aligned}
$$

Method 2: Use the distributive property.
$S A=2(42+21+18)$
$S A=2(42)+2(21)+2(18)$
$S A=162 \mathrm{~cm}^{2}$

Areas of Net Polygons for Prism (Note: Figures not drawn to scale.)

Top/bottom
Area $=\boldsymbol{\ell} \times w$

$$
A=7(6)
$$

$$
A=42 \mathrm{~cm}^{2}
$$

L.

Sides (both)

$$
A=7(3)
$$

Area $=\boldsymbol{\ell} \times w$

$$
A=21 \mathrm{~cm}^{2}
$$

Front/back
Area $=w \times h$
Area $w \times h$ Mathematics And Teaching

## Math <br> GRADE 6

By the end of the packet, your student should know...

- How to use drawings or visuals of parallelograms, triangles, and trapezoids that can be cut up and rearranged to help make sense of how their area formulas are derived [Lesson 9.1]
- The area formulas of parallelograms, triangles, and trapezoids and how to use them to solve problems in context [Lesson 9.1]
- How to distinguish between prisms and pyramids, create them using nets, find the surface area using the nets, and solve surface area problems in context [Lesson 9.2]
- How to derive the formulas for the volume of rectangular prisms, find volumes with fractional edge lengths, and solve volume problems in context [Lesson 9.3]

## Additional Resources

- For definitions and additional notes please refer to section 9.5.
- For deriving the formula for finding the area of a parallelogram: https://bit.Iy/2BrBbJy
- For deriving the formula for finding the volume of a rectangular prism: https://biit.ly/2YOqVTS
